

# Package ‘twitterR’

July 2, 2014

**Title** R based Twitter client

**Description** Provides an interface to the Twitter web API

**Version** 1.1.7

**Author** Jeff Gentry <geoffjentry@gmail.com>

**Maintainer** Jeff Gentry <geoffjentry@gmail.com>

**Depends** R (>= 2.12.0), ROAuth (>= 0.9.3), RCurl, rjson (>= 0.2.12), methods

**License** Artistic-2.0

**LazyData** yes

**URL** <http://lists.hexdump.org/listinfo.cgi/twitter-users-hexdump.org>

**Collate** allGenerics.R base.R account.R statuses.R users.R trends.R  
s4methods.R convert.R dm.R comm.R followers.R search.R toys.R utils.R zzz.R

**NeedsCompilation** no

**Repository** CRAN

**Date/Publication** 2013-07-09 17:42:20

---

decode_short_url	<i>A function to decode shortened URLs</i>
------------------	--

---

**Description**

Will expand a URL that has been processed by a link shortener (e.g. bit.ly). Provided as a convenience function to users who may wish to perform this operation.

**Usage**

decode\_short\_url(url, ...)

**Arguments**

- url                    A character string, the URL to decode
- ...                    Optional arguments to pass along to RCurl

**Details**

Uses the [longapi.org](http://longapi.org) API

**Value**

A character string containing either the original URL (if not shortened) or the full URL (if shortened)

**Author(s)**

Neil Jang

**References**

[longapi.org](http://longapi.org)

**Examples**

```
## Not run:
  decode_short_url("http://bit.ly/23226se656")

## End(Not run)
```

---

directMessage-class      *Class "directMessage": A class to represent Twitter Direct Messages*

---

**Description**

Provides a model representing direct messages (DMs) from Twitter

**Details**

The directMessage class is implemented as a reference class. As there should be no backwards compatibility issues, there are no S4 methods provided as with the user and status classes. An instance of a generator for this class is provided as a convenience to the user as it is configured to handle most standard cases. To access this generator, use the object dmFactory. Accessor set & get methods are provided for every field using reference class \$accessors() methodology (see [setRefClass](#) for more details). As an example, the sender field could be accessed using object\$getSender() and object\$setSender().

The constructor of this object assumes that the user is passing in a JSON encoded Twitter Direct Message. It is also possible to directly pass in the arguments.

**Fields**

text: Text of the DM  
 recipient: A user object representing the recipient of the message  
 recipientSN: Screen name of the recipient  
 recipientID: ID number of the recipient  
 sender: A user object representing the sender of the message  
 senderSN: Screen name of the sender  
 senderID: ID number of the sender  
 created: When the messages was created

**Methods**

destroy: Deletes this DM from Twitter. A wrapper around [dmDestroy](#)  
 toDataFrame: Converts this into a one row [data.frame](#), with each field representing a column. This can also be accomplished by the S4 style `as.data.frame(objectName)`.

**Author(s)**

Jeff Gentry

**See Also**

[dmGet](#), [dmSend](#), [dmDestroy](#), [setRefClass](#)

**Examples**

```
## Not run:
dm <- dmFactory$new(text='foo', recipientSN='blah')
dm$getText()

## assume 'json' is the return from a Twitter call
dm <- dmFactory$new(json)
dm$getSenderID()

## End(Not run)
```

---

dmGet

*Functions to manipulate Twitter direct messages*

---

**Description**

These functions allow you to interact with, send, and delete direct messages (DMs) in Twitter.

**Usage**

```
dmGet(n=25, sinceID=NULL, maxID=NULL, ...)
dmSent(n=25, sinceID=NULL, maxID=NULL, ...)
dmDestroy(dm, ...)
dmSend(text, user, ...)
```

**Arguments**

text	The text of a message to send
user	The user to send a message to, either character or an <a href="#">user</a> object.
dm	The message to delete, an object of class <a href="#">directMessage</a>
n	The maximum number of direct messages to return
sinceID	If not NULL, an ID representing the earliest boundary
maxID	If not NULL, an ID representing the newest ID you wish to retrieve
...	Further arguments to pass along the communication chain

**Value**

These functions will not work without OAuth authentication

The `dmGet` and `dmSent` functions will return a list of [directMessage](#) objects. The former will retrieve DMs sent to the user while the latter retrieves messages sent from the user.

The `dmDestroy` function takes a [directMessage](#) object (perhaps from either `dmGet` or `dmSent`) and will delete it from the Twitter server.

The `dmSend` function will send a message to another Twitter user.

**Author(s)**

Jeff Gentry

**See Also**[directMessage](#), [registerTwitterOAuth](#)**Examples**

```
## Not run:
  dms <- dmGet()
  dms
  ## delete the first one
  dms[[1]]$destroy()
  dmDestroy(dms[[2]])
  ## send a DM
  dmSend('Testing out twitteR!', 'twitter')

## End(Not run)
```

---

favorites*A function to get favorite tweets*

---

**Description**

Returns the n most recently favorited tweets from the specified user.

**Usage**

```
favorites(user, n = 20, max_id = NULL, since_id = NULL, ...)
```

**Arguments**

user	The Twitter user to detail, can be character or an <a href="#">user</a> object.
n	Number of tweets to retrieve, up to a maximum of 200
max_id	Maximum ID to search for
since_id	Minimum ID to search for
...	Optional arguments to pass along to RCurl

**Value**

A list of `link{status}` objects corresponding to the n most recent tweets

**Author(s)**

Jeff Gentry

## References

<https://dev.twitter.com/docs/api/1.1/get/favorites/list>

## See Also

[getUser](#), [status](#)

## Examples

```
## Not run:
  fav = favorites("barackobama", n=100)

## End(Not run)
```

---

friendships

*A function to detail relations between yourself & other users*

---

## Description

This function will accept a list of other Twitter users and will detail if they follow you and/or you follow them.

## Usage

```
friendships(screen_names = character(), user_ids = character(), ...)
```

## Arguments

screen_names	A vector of one or more Twitter screen names
user_ids	A vector of one or more Twitter user id values
...	Any other arguments to pass to RCurl

## Details

The combined number of screen names and user ids may not exceed 100. Any non-existent users will be dropped from the output

## Value

A data.frame, one row for each user requested with columns name, screen\_name, id, following and followed\_by. The latter two columns will be TRUE or FALSE depending on that user's relations with your account.

## Author(s)

Jeff Gentry

## References

<https://dev.twitter.com/docs/api/1.1/get/friendships/lookup>

## See Also

[registerTwitterOAuth](#)

## Examples

```
## Not run:
  friendships()

## End(Not run)
```

---

getCurRateLimitInfo	<i>A function to retrieve current rate limit information</i>
---------------------	--

---

## Description

Will retrieve the current rate limit information for the authenticated user, displayed as a data.frame displaying specific information for every Twitter resource

## Usage

```
getCurRateLimitInfo(resources=character(), ...)
```

## Arguments

resources	An optional character vector of specific resources to get information for
...	Optional arguments to pass to cURL

## Details

Using the resources argument will filter the returned data.frame to only list the specified resource values

The full list of allowed values in resources is as follows: lists, application, friendships, blocks, geo, users, followers, statuses, help, friends, direct\_messages, account, favorites, saved\_searches, search, trends

## Value

A four column data.frame with columns resource, limit, remaining and reset. These detail the specific resource name, the rate limit for that block, the number of calls remaining and the time the rate limit will be reset in UTC time.

## Author(s)

Jeff Gentry

**Examples**

```
## Not run:
zz <- getCurRateLimitInfo(c("lists", "users"))

## End(Not run)
```

---

getTrends

*Functions to view Twitter trends*

---

**Description**

These functions will allow you to interact with the trend portion of the Twitter API

**Usage**

```
availableTrendLocations(...)
closestTrendLocations(lat, long, ...)
getTrends(woeid, exclude=NULL, ...)
```

**Arguments**

woeid	A numerical identification code describing a location, a Yahoo! Where On Earth ID
lat	A numerical latitude value, between -180 and 180 inclusive. West is negative, East is positive
long	A numerical longitude value, between -180 and 180 inclusive. South is negative, North is positive
exclude	If set to hashtags, will exclude hashtags
...	Additional arguments to be passed to RCurl

**Details**

The availableTrendLocations and closestTrendLocations functions will return a data.frame with three columns - name, country and woeid. The closestTrendLocations function will return the locations closest to the specified latitude and longitude.

The getTrends function takes a specified woeid and returns the trending topics associated with that woeid. It returns a data.frame with the columns being name, url, promoted\_content, query and woeid - one row per trend.

**Value**

A data.frame with the columns specified in Details above

**Author(s)**

Jeff Gentry

## Examples

```
## Not run:
  woeid = availableTrendLocations[1, "woeid"]
  t1 <- getTrends(woeid)

## End(Not run)
```

---

getUser

*Functions to manage Twitter users*

---

## Description

These functions allow you interact with information about a Twitter user - retrieving their base information, list of friends, list of followers, and an up to date timeline.

## Usage

```
getUser(user, ...)
lookupUsers(users, includeNA=FALSE, ...)
```

## Arguments

user	The Twitter user to detail, can be character or an <a href="#">user</a> object.
users	A vector of either user IDs or screen names or a mix of both
includeNA	If TRUE will leave an NA element in the return list for users that don't exist
...	Optional arguments to be passed to <a href="#">getURL</a>

## Details

These functions will only return fully formed objects if the authenticated user is allowed to see the requested user. If that person has a private account and has not allowed you to see them, you will not be able to extract that information.

The lookupUsers function should be used in cases where there are multiple lookups going to take place, to reduce the API call load. This function requires OAuth authentication.

## Value

The getUser function returns an object of class [user](#).

The lookupUsers function will return a list of [user](#) objects, sorted in the order of the users argument, with names being the particular element of users that it matches to. If the includeNA argument is set to FALSE (default), any non-existing users will be dropped from the list.

## Author(s)

Jeff Gentry

**See Also**[mentions](#)**Examples**

```
## Not run:
tuser <- getUser('geoffjentry')
users <- lookupUsers(c('geoffjentry', 'whitehouse'))

## End(Not run)
```

---

import\_statuses*Functions to import twitteR objects from various sources*

---

**Description**

Functions designed to import data into twitteR objects from a variety of data sources. Currently only JSON is supported, and this entire branch of functionality should be considered experimental & under development.

**Usage**

```
import_statuses(raw_data, conversion_func = json_to_statuses)
import_trends(raw_data, conversion_func = json_to_trends)
import_users(raw_data, conversion_func = json_to_users)
import_obj(raw_data, conversion_func, ...)
json_to_users(raw_data)
json_to_statuses(raw_data)
json_to_trends(raw_data)
```

**Arguments**

raw_data	Data to be be parsed via the prescribed function
conversion_func	The function to convert raw_data into the specified twitteR object
...	Arguments to pass along to conversion_func

**Value**

A list of twitteR objects of the appropriate type, e.g. [status](#), [user](#), etc

**Author(s)**

Jeff Gentry

**See Also**[status](#), [user](#)

### Examples

```
## Not run:
  status_list = import_statuses(list_of_status_json)

## End(Not run)
```

---

registerTwitterOAuth	<i>Register OAuth credentials to twitter R session</i>
----------------------	--

---

### Description

This function is used to provide your OAuth access tokens to your twitter session. This will enable many bits of functionality as well as allow other commands to provide more options

### Usage

```
getTwitterOAuth(consumer_key, consumer_secret)
registerTwitterOAuth(oauth)
```

### Arguments

consumer_key	The consumer key supplied by Twitter
consumer_secret	The consumer secret supplied by Twitter
oauth	An object of class OAuth

### Details

The getTwitterOAuth function is a wrapper around the call to OAuthFactory and registerTwitterOAuth, which will return the registered credentials. If your workflow is such that you save the credentials and register them in later R sessions, feel free to do this using registerTwitterOAuth

registerTwitterOAuth will store the OAuth argument in an environment which is then accessed throughout the package. When API calls are made, instead of going through RCurl they will go through the ROAuth package.

Three URLs will need to be used for the initial OAuth handshake, see the examples below.

### Value

TRUE on success, otherwise an error will be thrown

### Author(s)

Jeff Gentry

### See Also

OAuth

## Examples

```
## Not run:
## A real example, but using a fictitious consumerkey and consumer
## secret - you'll need to supply your own
reqURL <- "https://api.twitter.com/oauth/request_token"
accessURL <- "http://api.twitter.com/oauth/access_token"
authURL <- "http://api.twitter.com/oauth/authorize"
consumerKey <- "12345pqrst6789ABCD"
consumerSecret <- "abcd1234EFGH5678ijkl0987MNOP6543qrst21"
twitCred <- OAuthFactory$new(consumerKey=consumerKey,
                             consumerSecret=consumerSecret,
                             requestURL=reqURL,
                             accessURL=accessURL,
                             authURL=authURL)

twitCred$handshake()
registerTwitterOAuth(twitCred)

## End(Not run)
```

---

searchTwitter

*Search twitter*

---

## Description

This function will issue a search of Twitter based on a supplied search string.

## Usage

```
searchTwitter(searchString, n=25, lang=NULL, since=NULL, until=NULL,
              locale=NULL, geocode=NULL, sinceID=NULL,
              retryOnRateLimit=120, ...)
Rtweets(n=25, lang=NULL, since=NULL, ...)
```

## Arguments

searchString	Search query to issue to twitter
n	The maximum number of tweets to return
lang	If not NULL, restricts tweets to the given language, given by an ISO 639-1 code
since	If not NULL, restricts tweets to those since the given date. Date is to be formatted as YYYY-MM-DD
until	If not NULL, restricts tweets to those up until the given date. Date is to be formatted as YYYY-MM-DD
locale	If not NULL, will set the locale for the search. As of 03/06/11 only ja is effective, as per the Twitter API
geocode	If not NULL, returns tweets by users located within a given radius of the given latitude/longitude. See Details below for more information

sinceID	If not NULL, returns tweets with IDs greater (ie newer) than the specified ID
retryOnRateLimit	If non-zero the search command will block retry up to X times if the rate limit is experienced. This might lead to a much longer run time but the task will eventually complete if the retry count is high enough
...	Optional arguments to be passed to <a href="#">getURL</a>

## Details

These commands will return any authorized tweets which match the search criteria. Note that there are pagination restrictions as well as other limits on what can be searched, so it is always possible to not retrieve as many tweets as was requested with the `n` argument. Authorized tweets are public tweets as well as those protected tweets that are available to the user after authenticating via [registerTwitterOAuth](#).

For the `geocode` argument, the values are given in the format `latitude,longitude,radius`, where the radius can have either `mi` (miles) or `km` (kilometers) as a unit. For example `geocode='37.781157,-122.39720,1mi'`.

For the `sinceID` argument, if the requested ID value is older than the oldest available tweets, the API will return tweets starting from the oldest ID available.

The `Rtweets` function is a wrapper around `searchTwitter` which hardcodes in a search for `#rstats`.

## Value

A list of [status](#) objects

## Author(s)

Jeff Gentry

## See Also

[status](#), [registerTwitterOAuth](#)

## Examples

```
## Not run:
searchTwitter("#beer", n=100)
  Rtweets(n=37)

## Search between two dates
searchTwitter('charlie sheen', since='2011-03-01', until='2011-03-02')

## geocoded results
searchTwitter('patriots', geocode='42.375,-71.1061111,10mi')

## End(Not run)
```

---

showStatus	<i>A function to return one specific tweet</i>
------------	--

---

### Description

This function will take a numeric ID of a tweet and return it to the user

### Usage

```
showStatus(id, ...)
```

### Arguments

id	Numerical ID of a specific tweet
...	Optional arguments to be passed to <a href="#">getURL</a>

### Value

An object of class [status](#)

### Author(s)

Jeff Gentry

### See Also

[status](#)

### Examples

```
## Not run:  
showStatus('123')  
  
## End(Not run)
```

---

status-class	<i>Class to contain a Twitter status</i>
--------------	--

---

### Description

Container for Twitter status messages, including the text as well as basic information

## Details

The status class is implemented as a reference class. This class was previously implemented as an S4 class, and for backward compatibility purposes the old S4 accessor methods have been left in, although new code should not be written with these. An instance of a generator for this class is provided as a convenience to the user as it is configured to handle most standard cases. To access this generator, use the object `statusFactory`. Accessor set & get methods are provided for every field using reference class `$accessors()` methodology (see [setRefClass](#) for more details). As an example, the `screenName` field could be accessed using `object$getScreenName` and `object$setScreenName`.

The constructor of this object assumes that the user is passing in a JSON encoded Twitter status. It is also possible to directly pass in the arguments.

## Fields

**text:** The text of the status  
**screenName:** Screen name of the user who posted this status  
**id:** ID of this status  
**replyToSN:** Screen name of the user this is in reply to  
**replyToUID:** ID of the user this was in reply to  
**statusSource:** Source user agent for this tweet  
**created:** When this status was created  
**truncated:** Whether this status was truncated  
**favorited:** Whether this status has been favorited  
**retweeted:** TRUE if this status has been retweeted  
**retweetCount:** The number of times this status has been retweeted

## Methods

**toDataFrame:** Converts this into a one row [data.frame](#), with each field representing a column. This can also be accomplished by the S4 style `as.data.frame(objectName)`.

## Author(s)

Jeff Gentry

## See Also

[userTimeline](#), [setRefClass](#)

## Examples

```
## Not run:  
st <- statusFactory$new(screenName="test", text="test message")  
st$getScreenName()  
st$getText()
```

```
## Assume 'json' is the return from a Twitter call
st <- statusFactory$new(json)
st$getScreenName()

## End(Not run)
```

---

taskStatus

*A function to send a Twitter DM after completion of a task*

---

## Description

This function will run an R expression and send a direct message to a specified user on success or failure.

## Usage

```
taskStatus(expr, to, msg="")
```

## Arguments

expr	An R expression that will be run
to	The user to send a message to, either character or an <a href="#">user</a> object.
msg	An extra message to append to the standard DM

## Details

This function will run expr, and send a Direct Message (DM) upon completion which will report the expression's success or failure.

## Value

Either the value of the expression or an object of class try-error.

## Author(s)

Jeff Gentry

## See Also

[dmSend](#)

## Examples

```
## Not run:
taskStatus(z<-5, "username", session=sess)

## End(Not run)
```

---

timelines*Functions to view Twitter timelines*

---

**Description**

These functions will allow you to retrieve various timelines within the Twitter universe

**Usage**

```
userTimeline(user, n=20, maxID=NULL, sinceID=NULL, includeRts=FALSE, ...)
homeTimeline(n=25, maxID=NULL, sinceID=NULL, ...)
mentions(n=25, maxID=NULL, sinceID=NULL, ...)
retweetsOfMe(n=25, maxID=NULL, sinceID=NULL, ...)
```

**Arguments**

user	The Twitter user to detail, can be character or an <a href="#">user</a> object.
n	Number of tweets to retrieve, up to a maximum of 3200
maxID	Maximum ID to search for
sinceID	Minimum (not inclusive) ID to search for
includeRts	If FALSE any native retweets (not old style RT retweets) will be stripped from the results
...	Optional arguments to be passed to <a href="#">getURL</a>

**Value**

A list of [status](#) objects

**Author(s)**

Jeff Gentry

**See Also**

[getUser](#), [status](#), [registerTwitterOAuth](#)

**Examples**

```
## Not run:
  ut <- userTimeline('barackobama', n=100)

## End(Not run)
```

---

`twListToDF`*A function to convert twitteR lists to data.frames*

---

### Description

This function will take a list of objects from a single twitteR class and return a data.frame version of the members

### Usage

```
twListToDF(twList)
```

### Arguments

`twList`                    A list of objects of a single twitteR class, restrictions are listed in details

### Details

The classes supported by this function are [status](#), [user](#), and [directMessage](#).

### Value

A [data.frame](#) with rows corresponding to the objects in the list and columns being the fields of the class

### Author(s)

Jeff Gentry

### See Also

[status](#), [user](#), [directMessage](#)

### Examples

```
## Not run:
zz <- searchTwitter("#rstats")
twListToDF(zz)

## End(Not run)
```

---

updateStatus	<i>Functions to manipulate Twitter status</i>
--------------	---

---

**Description**

These functions can be used to set or delete a user's Twitter status

**Usage**

```
tweet(text, ...)
updateStatus(text, lat=NULL, long=NULL, placeID=NULL,
             displayCoords=NULL, inReplyTo=NULL, ...)
deleteStatus(status, ...)
```

**Arguments**

text	The text to use for a new status
status	An object of class <a href="#">status</a>
lat	If not NULL, the latitude the status refers to. Ignored if no long parameter is provided
long	If not NULL, the longitude the status refers to. Ignored if no lat parameter is provided
placeID	If not NULL, provides a place in the world. See Twitter documentation for details
displayCoords	Whether or not to put a pin on the exact coordinates a tweet has been sent from, true or false if not NULL
inReplyTo	If not NULL, denotes the status this is in reply to. Either an object of class <a href="#">status</a> or an ID value
...	Optional arguments to be passed to <a href="#">getURL</a>

**Details**

These messages will only operate properly if the user is authenticated via OAuth

The tweet and updateStatus functions are the same.

To delete a status message, pass in an object of class [status](#), such as from the return value of updateStatus.

**Value**

The updateStatus function will return an object of class [status](#).

The deleteStatus returns TRUE on success and an error if failure occurs.

**Author(s)**

Jeff Gentry

**See Also**[registerTwitterOAuth](#)**Examples**

```
## Not run:
ns <- updateStatus('this is my new status message')
## ooops, we want to remove it!
deleteStatus(ns)

## End(Not run)
```

user-class

*A container object to model Twitter users***Description**

This class is designed to represent a user on Twitter, modeling information available

**Details**

The user class is implemented as a reference class. This class was previously implemented as an S4 class, and for backward compatibility purposes the old S4 accessor methods have been left in, although new code should not be written with these. An instance of a generator for this class is provided as a convenience to the user as it is configured to handle most standard cases. To access this generator, use the object `userFactory`. Accessor set & get methods are provided for every field using reference class `$accessors()` methodology (see [setRefClass](#) for more details). As an example, the `screenName` field could be accessed using `object$getScreenName` and `object$setScreenName`.

The constructor of this object assumes that the user is passing in a JSON encoded Twitter user. It is also possible to directly pass in the arguments.

**Fields**

**name:** Name of the user  
**screenName:** Screen name of the user  
**id:** ID value for this user  
**lastStatus:** Last status update for the user  
**description:** User's description  
**statusesCount:** Number of status updates this user has had  
**followersCount:** Number of followers for this user  
**favoritesCount:** Number of favorites for this user  
**friendsCount:** Number of followees for this user  
**url:** A URL associated with this user

**created:** When this user was created  
**protected:** Whether or not this user is protected  
**verified:** Whether or not this user is verified  
**location:** Location of the user  
**listedCount:** The number of times this user appears in public lists  
**followRequestSent:** If authenticated via OAuth, will be TRUE if you've sent a friend request to this user  
**profileImageUrl:** URL of the user's profile image, if one exists

### Methods

**getFollowerIDs(n=NULL, ...):** Will return a vector of twitter user IDs representing followers of this user, up to a maximum of n values. If n is NULL, all followers will be returned  
**getFollowers(n=NULL, ...):** Will return a list of user objects representing followers of this user, up to a maximum of n values. If n is NULL, all followers will be returned  
**getFriendIDs(n=NULL, ...):** Will return a vector of twitter user IDs representing users this user follows, up to a maximum of n values. If n is NULL, all friends will be returned  
**getFriends(n=NULL, ...):** Will return a list of user objects representing users this user follows, up to a maximum of n values. If n is NULL, all friendss will be returned  
**toDataFrame(row.names=NULL, optional=FALSE):** Converts this into a one row [data.frame](#), with each field except for `lastStatus` representing a column. This can also be accomplished by the S4 style `as.data.frame(objectName)`.

### Author(s)

Jeff Gentry

### Examples

```
## This example is run, but likely not how you want to do things
us <- userFactory$new(screenName="test", name="Joe Smith")
us$getScreenName()
us$getName()

## Not run:
## Assume 'json' is the return from a Twitter call
us <- userFactory$new(json)
us$getScreenName()

## End(Not run)
```
